11. What is denormalization?

Answer: Denormalization is a strategy used on a previously-normalized database to increase performance. In computing, denormalization is the process of trying to improve the read performance of a database, at the expense of losing some write performance, by adding redundant copies of data or by grouping data.

12. What is a database cursor?

Answer: A database cursor is an identifier associated with a group of rows. It is, in a sense, a pointer to the current row in a buffer. You must use a cursor in the following cases: Statements that return more than one row of data from the database server: A SELECT statement requires a select cursor.

13. What are the different types of the queries?

Answer: Five types of SQL queries are as follows:

1) Data Definition Language (DDL)
2) Data Manipulation Language (DML)
3) Data Control Language(DCL)
4) Transaction Control Language(TCL)
5) Data Query Language (DQL)

14. Define constraint?

Answer: SQL constraints are used to specify rules for the data in a table. Constraints are used to limit the type of data that can go into a table. This ensures the accuracy and reliability of the data in the table.

15. What is auto increment?

Answer: Auto-increment allows a unique number to be generated automatically when a new record is inserted into a table. Often this is the primary key field that we would like to be created automatically every time a new record is inserted.
